

Measurement of Time Difference

Kuniyasu Imamura, Hiroyuki Itoh,
Noboru Kotake and Fumimaru Nakagawa

Outline

- Time Interval Counter
- DMTD method
 - ◆ Principle of DMTD
 - ◆ Measurement of Time Difference using DMTD system
 - ◆ Demonstration of DMTD system and comparison with a commercial time interval counter.
- Clock transportation
 - ◆ Method of Clock transportation
 - ◆ Practice of Clock transportation

Procedure of Measurement of Time difference by SR620

- ① Turn on the switch.
- ② Connect Reference signal to the rear connector "10MHz in" and check the red light at "CONFIG - CLOCK" is clear.
(to measure using reference signal)
- ③ Connect two signals to connectors.
- ④ Set measurement parameters.
 - (4-1) "MODE : TIME"
 - (4-2) "SOURCE : A"
 - (4-3) "GATE/ARM : +TIME"
 - (4-4) "SAMPLE SIZE : 1"
 - (4-5) "DISPLAY : TRIG"

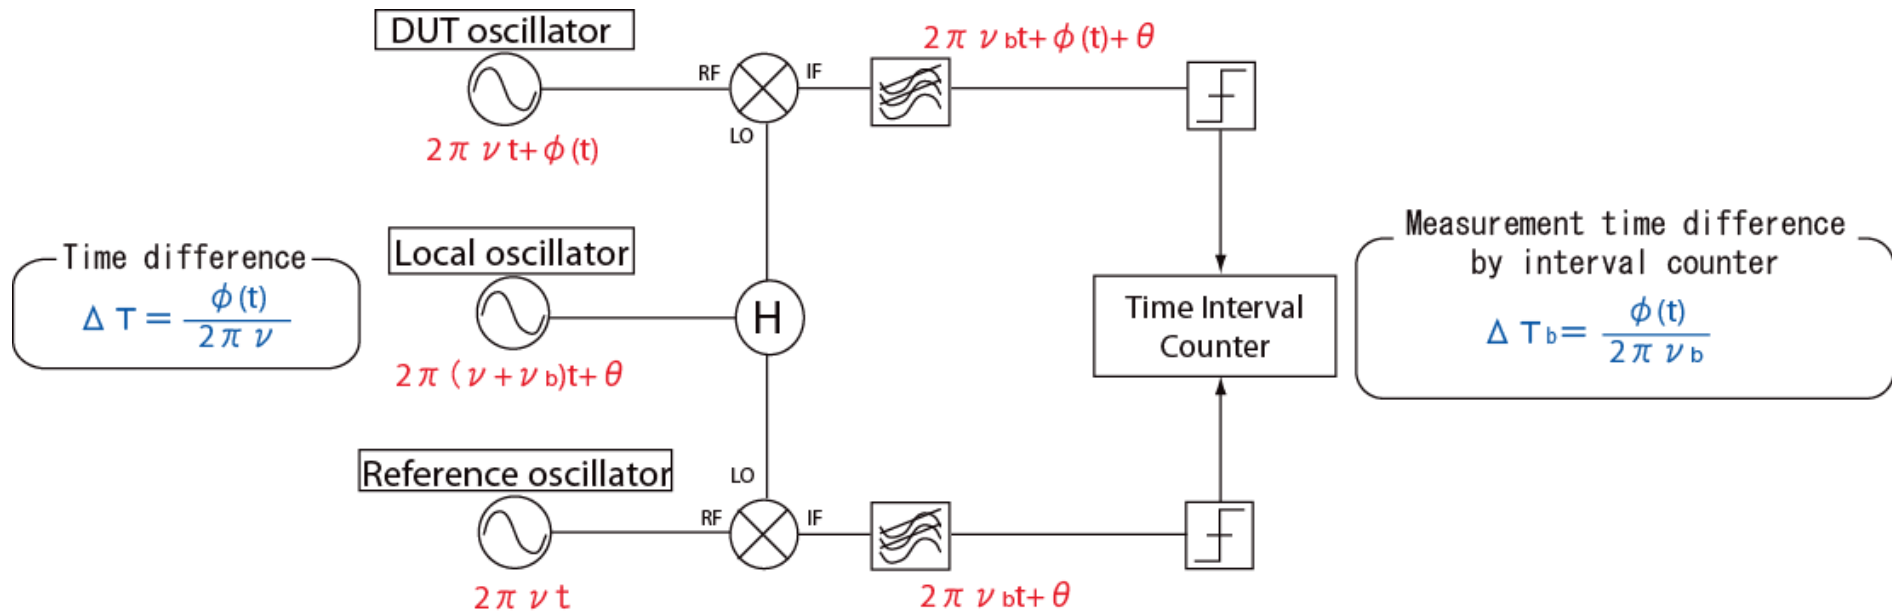

Procedure of Measurement of Time difference by SR620

- ⑤ Set both “START” and “STOP” Trigger parameters
(Each parameter is adapted to input signals.)
- (5-1) “LEVEL : 1.0V” and check flashing “TRIG light”
 - (5-2) “SLOPE : +”
 - (5-3) “AC/DC : DC”
 - (5-4) “INPUT : 50Ω”
- ⑥ Set measurement parameters “DISPLAY : MEAN”

Dual Mixer Time Difference (DMTD)

- Using two double balanced mixer, both a reference signal and a DUT signal are down-converted by the same local signal.
- Before and after the down-convert, a phase difference between Reference and DUT dose not change, but frequency is decreased.
- As a result, a time difference measured by TIC is amplified and a measurement precision of time difference is improved.

- A reference signal and a Device Under the test (DUT) signal are down-converted to ν_b by a local signal.
- Time difference (ΔT_b) between two down-converted signals is measured by time interval counter.
- Time difference ΔT is calculated, as $\Delta T = \Delta T_b \times \nu_b / \nu$.
- The accuracy of measurement is improved by a factor (ν / ν_b) .

Demonstration of DMTD

- Frequency stability of TIC(SR-620)
- Frequency stability of DMTD system
- Measurement of Cesium atomic clock by TIC
- Measurement of Cesium atomic clock by DMTD system

Measurement of Time Difference

- **Using Time Interval Counter**

- * Measurement of absolute value (using 1pps)

- *The precision is a few 10ps

- ~ 10 s averaging time for Cs clock

- ~ 10000 s averaging time for HM clock

- **Using DMTD method**

- *Measurement with high precision

- *Only measurement of relative value is possible.

- *Using carrier signal (ex. 5Mhz)

- *The precision is below a few 0.1ps

- We can measure the frequencies both Cs and HM from 1s averaging time.

Frequency stabilities of measurement systems and atomic clocks

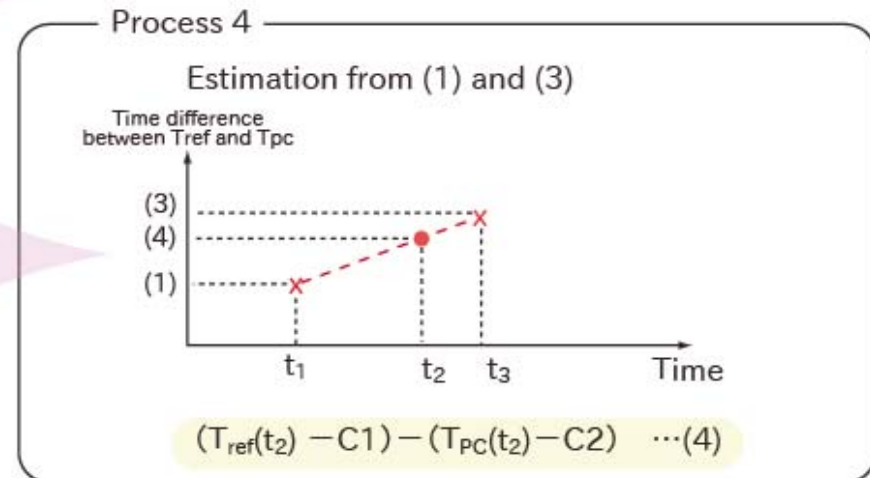

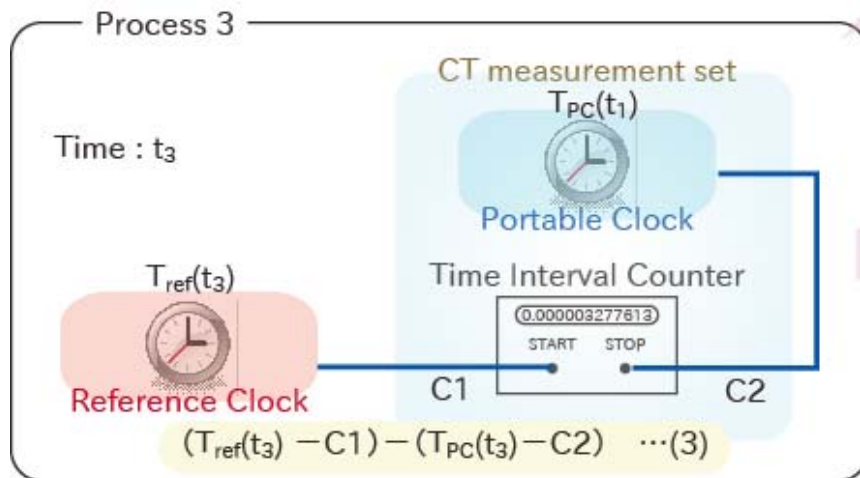

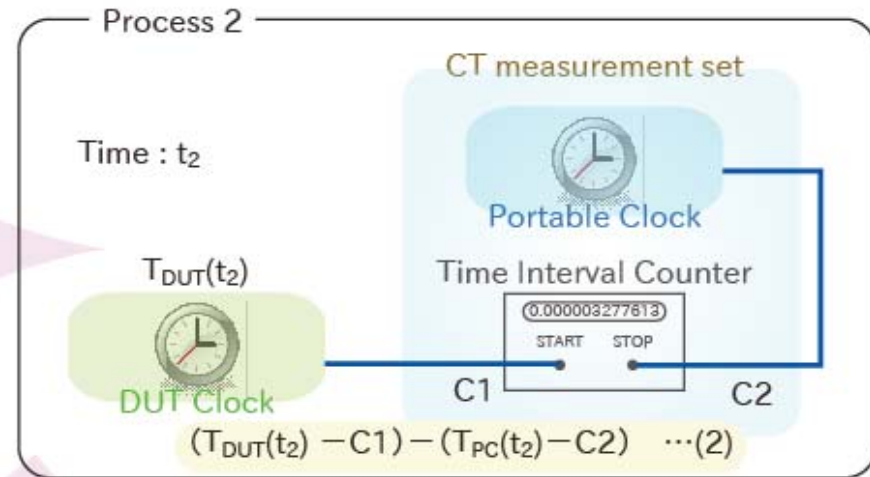

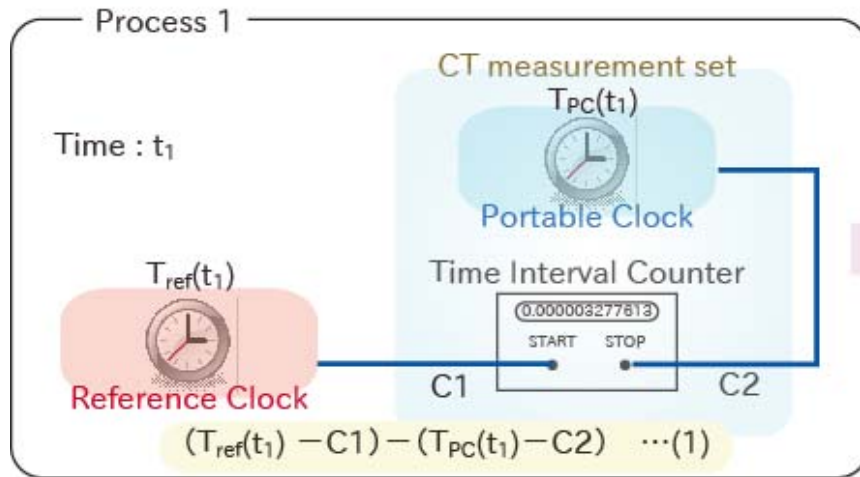

Measurement of Time Difference and Cable Delay using Clock Transportation

(1) Measurement of time difference
between two clocks with some distance

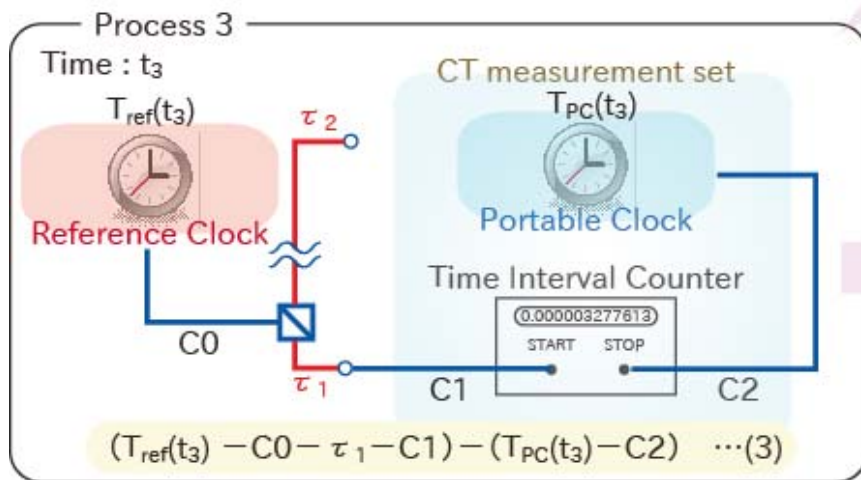

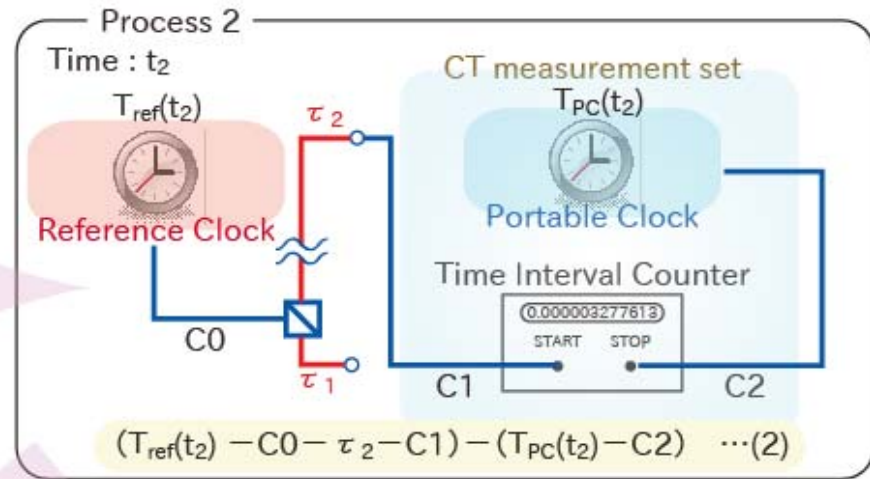

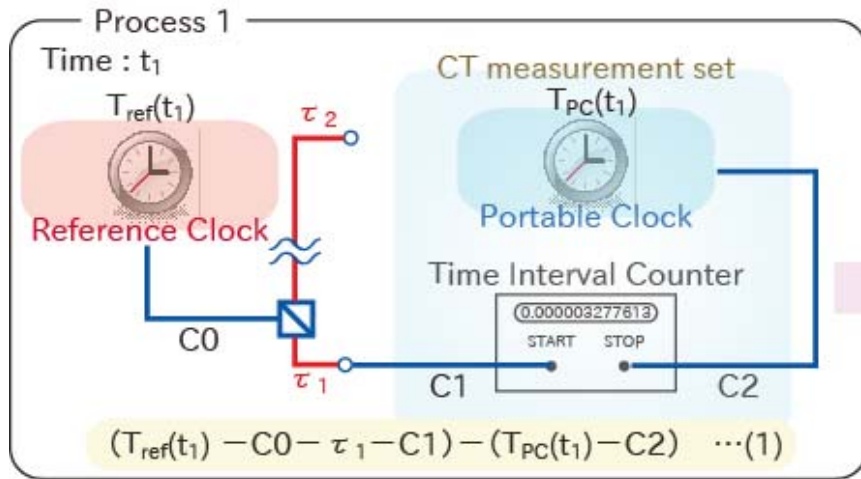

(2) Measurement of cable delay

Measurement of time difference between two clocks far from each other.

$$(4) - (2) \rightarrow T_{ref}(t_2) - T_{DUT}(t_2)$$

Measurement of cable delay.

$$(4) - (2) \rightarrow \tau_2(t_2) - \tau_1(t_2)$$

Let's practice Clock transportation !! (measurement of cable delay)

- Check TIC parameter at each measurement
 - Reference signal
 - Trigger parameter (level, impedance, slope...)

Impedance 50 Ω High
 Slope positive negative
 Trigger level _____ V

① Measurement-1

- Connect a reference cable to input-A of TIC.
- Set parameters of TIC
- Measure a time difference three times and record a value and time

①	Time	Time diff	Jitter
1st	_____	_____	_____
2nd	_____	_____	_____
3rd	_____	_____	_____
Avg.	_____	_____	_____

② Measurement-2

- Connect a DUT cable to input-A of TIC.
- Set parameters of TIC
- Measure a time difference three times and record a value and time

②	Time	Time diff	Jitter
1st	_____	_____	_____
2nd	_____	_____	_____
3rd	_____	_____	_____
Avg.	_____	_____	_____

③ Measurement-3

- Connect a reference cable to input-A of TIC.
- Set parameters of TIC
- Measure a time difference three times and record a value and time

③	Time	Time diff	Jitter
1st	_____	_____	_____
2nd	_____	_____	_____
3rd	_____	_____	_____
Avg.	_____	_____	_____

④ Estimation

- Estimate the time difference between the reference point and the portable clock at ② using linear fitting

④	Time	Time diff
①	_____	_____
③	_____	_____
④	_____	_____

⑤ Calculation

- Calculate the cable delay from ② and ④.

④	—	②	—	Cable delay
_____	—	_____	=	_____
